Now, the fun part—planting!
Here's how:

1. Broadcast or Drill: Spread seeds evenly with a broadcaster or use a seed drill for precision.
2. Cover Lightly: Rake or roll seeds into the soil (no deeper than ¼ inch for small seeds like clover).
3. Water if Dry: If rain isn't in the forecast, lightly water to kickstart germination.

Planting is just the start—maintenance keeps it productive:

- Weed Control:
 - For clover plots:
 - Mow or spray herbicides (safe for your seed type) if weeds emerge. Check local regulations before spraying, and always consider wind direction and overspray when spraying.
 - To remove grasses, consider clethodim; to remove broadleaf weeds, consider 2,4-DB (NOT 2,4-D - this will kill everything!)
 - For Shady Patch:
 - No need to do weed control, just apply nitrogen as listed below.
- Fertilize Again: Apply a light nitrogen boost 4 - 6 weeks after planting near an expected rain.
- Monitor Growth: Check weekly; expect sprouts in 7 - 14 days with good conditions.

Conclusion

Planting a spring food plot doesn't have to be complicated. With the right timing, location, soil prep, seeds, and care, you'll create a whitetail paradise by fall 2025. Whether you're using [Shady Patch Food Plot Seed](#) or boosting nutrition with [Full Throttle Mineral](#), this spring food plot planting guide has you covered. Get out there, get planting, and watch the deer roll in!
